This Regional Forum was organized by the Blue Solutions Initiative of the German Environment Ministry (BMUB), implemented by Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ), GRID-Arendal, the International Union for Conservation of Nature (IUCN), and the United Nations Environment Programme (UNEP), together with the World Future Council and the Lighthouse Foundation. It was convened in collaboration with the Sustainable Ocean Initiative (SOI) of the Secretariat of the Convention on Biological Diversity (CBD) and in partnership with the Biodiversity Management Bureau (BMB) of the Department of Environment and Natural Resources, Philippines (DENR).
Thanks to all solution providers and those who helped to write up the solutions:

The organizers extend their special thanks to the GIZ Philippines, especially to the team of the ACCCoast project for the wonderful logistical arrangements, facilitation of institutional and political stakeholders in the Philippines to attend the conference, event management, arrangement of the inspiring evening programme and overall support to make this forum possible.

72 IMPRINT
The ocean covers over 70% of the planet’s surface and plays a crucial role for the global ecological equilibrium. Humans depend on oceans and coasts for their well-being and economic development. Healthy marine and coastal ecosystems are highly productive and provide a multitude of valuable goods and services. These range from food, medicine, climate regulation and coastal protection to recreational opportunities and spiritual benefits.

Despite their global significance, marine and coastal ecosystems face a wide array of threats – mainly due to anthropogenic causes. Habitat loss and degradation, overfishing and destructive fishing methods, eutrophication and pollution deteriorate the state of our ocean. In addition, the impacts of climate change are heavily affecting many ecosystems. Response to these threats is often limited due to a lack of regulation and enforcement, insufficient management and governance or limited awareness. To halt the loss of biodiversity and ecosystem services, it is crucial to make enhanced efforts at global, regional, national and local levels.

Therefore, the Blue Solutions Initiative supports partner countries to work towards the achievement of the coastal and marine related Aichi targets of the Convention on Biological Diversity (CBD). The overall goal is to enable global learning from real life experiences, support the creation of new partnerships and networks around positive cases, and build capacities to address coastal and marine challenges. The global project collates, documents and promotes so called »blue solutions« – successful case studies from all over the world – to inspire, share knowledge and support a worldwide exchange of replicable ideas to accelerate action for our ocean.

The 5-year project is funded through the International Climate Initiative (ICI) as a contribution of the German Environment Ministry (BMUB) and is being implemented jointly by GIZ, GRID-Arendal, IUCN and UNEP.

This publication is a result of Blue Solutions’ first Regional Forum on Solutions for Oceans, Coasts and Human Well-being in Asia and the Pacific. This three-day workshop was held on Mactan Island, Cebu, Philippines in May 2014. During this event more than 25 participants presented their positive examples and engaged with the larger audience in discussions around how these examples can be adapted to address pressing challenges faced in other regions or sectors in Africa. This publication compiles 27 blue solutions from Asia and the Pacific, most of which were presented. The cases are summarized within this publication and focus on topics such as marine protected areas, sustainable tourism, sustainable fisheries, sustainable livelihoods, conservation of resources and biodiversity and mitigation of the effects of climate change. It is an inspiring guide through activities and projects towards the protection and integrated, sustainable management of valuable and vulnerable coastal and marine ecosystems.

SOLUTIONS – APPROACHES THAT WORK
Blue solutions exist at all levels – from local to global – and address challenges in a variety of ways, from technical infrastructure or co-management approaches to policy-making or law enforcement. Thus, blue solutions are successful approaches or processes that...
- address marine and coastal challenges. They contribute to the maintenance or improvement of the health of biodiversity and ecosystems helping to achieve global sustainable development and the Sustainable Development Goals.
- are effective. They are specific, applied examples that have been implemented with a demonstrated positive impact.
- are scalable. Elements of a solution have the potential to be up-scaled and/or replicated in other geographic, social or sectorial contexts.

While a solution describes a context-specific example, we believe that every solution is composed of essential elements that determine its success – we call them building blocks. These building blocks, described as part of a solution story, may be adapted and recombined to address challenges in other socio-cultural and ecological contexts, sectors or geographies. The Blue Solutions Initiative has established building block categories according to their means of action. A glossary of all building blocks, sorted by category, can be found at the back of this publication and all solutions contributed are published on the marine and coastal portal of the Panorama platform.
SOLUTIONS EXCHANGE
One of Blue Solutions’ focal areas is the provision of a global knowledge platform to collate, share and generate solutions and access a broad network of practitioners and policy-makers. The overall aim is to inspire action towards effective management and equitable governance of our planet’s marine and coastal living spaces at all social and institutional levels. The exchange around solutions is realized through face-to-face meetings, the integration of solutions as real-life examples into capacity development formats as well as through an online platform.

FACE-TO-FACE SOLUTIONS EXCHANGE
Face-to-face meetings allow participants to learn about solutions from other regions or sectors, and experience how these examples can be adapted to other contexts. Workshops allow participants to establish new connections and networks with other practitioners and policy-makers. The Blue Solutions Initiative organizes face-to-face exchanges at different levels, adapting the format to its specific context. One outstanding series of events facilitated by the Blue Solutions initiative are Regional Fora for Oceans, Coasts and Human Well-being. The first regional event for Asia and the Pacific took place in Cebu, Philippines (2014), the second for Latin America and the Wider Caribbean Region in Cancún, Mexico (2015) and the third for Africa in Zanzibar, Tanzania (2016).

During the first 4-day regional solution-ing event, the »Regional Forum on Oceans, Coasts and Human Well-Being in Asia and the Pacific« more than 100 participants from 17 countries in Asia and the Pacific met to exchange their experiences. The forum welcomed participants from all backgrounds - local communities, civil society, parliaments and government officials all agreeing that we need to stop re-inventing the wheel when it comes to the sustainable management and conservation of marine and coastal resources.

CAPACITY DEVELOPMENT
Capacity development activities are a focal area of the Blue Solutions Initiative. Through different formats and cooperation with various partner institutions, the Blue Solutions Initiative seeks to enhance capacities for scaling up successes, provide learning opportunities and trainings on different marine and coastal themes and thus, support policy processes to facilitate action towards healthy marine and coastal systems.

ONLINE SOLUTIONS EXCHANGE
Blue Solutions is part of the Panorama – Solutions for a Healthy Planet partnership and hosts the »marine and coastal solutions« portal of the online Panorama platform (www.panorama.solutions). This online platform serves as one tool of the partnership and Blue Solutions to capture, share and exchange implemented solutions. In addition to the marine and coastal solutions portal, the Panorama platform currently houses a second thematic portal on protected area solutions, hosted by IUCN’s Global Protected Areas Program. The Panorama partnership is envisioned to constantly grow with new partners and solutions from other topics to support a truly inter-sectorial learning experience.

Blue Solution training events are designed for practitioners, technical staff and decision makers responsible for coastal and marine planning and management from different social sectors, such as government, civil society, and academia. Documented solutions serve as real-life examples of theoretical concepts and provide a valuable input to any training workshop.

Find us on Facebook (@BlueSolutionsInitiative) or follow us on Twitter (@_BlueSolutions) and get inspired every day!
The Peam Krasop Wildlife Sanctuary in Kho Kong Province, Cambodia, is one of the largest and most undisturbed re-generated mangrove forests in Southeast Asia. In order to address the need for climate change adaptation in the area, a co-management plan was developed for the sanctuary with participation of local communities.

The co-management plan will support ecosystem and social resilience through maintenance and restoration of mangrove areas, the implementation of a zoning system that regulates use of and movement in the sanctuary, the development of livelihood diversification and adaptation techniques for local communities, as well as the conservation of key species.

Mr. Veng Somsak, Deputy Chief of Koh Sralao Community Protected Area:

«From my understanding every protected area should have zoning to reduce conflicts between the Protected Area Authority and the users and to make it easy for the local community to participate in natural resources conservation. It is easier if people know where they can collect natural resources and where they cannot.»

This solution is being implemented by IUCN’s project Building Coastal Resilience to Climate Change Impacts in Southeast Asia, funded by the European Union.
The Pacific Islands region is among the world’s most vulnerable regions in the face of climate change. This also applies to Yap State, one of the four states making up the Federated States of Micronesia. This solution addresses the problem of declining fish and shellfish populations through effective management as well as enhancing community capacity to adapt to climate change in the State of Yap.

The community-based ecosystem approach to fisheries management (CEAFM) tackles these challenges by raising awareness on different fishing practices, developing community-owned management and conservation measures, and by introducing Fish Aggregating Devices (FADs) that attract pelagic fish to offshore areas in order to alleviate fish pressure on inshore areas. This management helps to improve catch rates and provides alternative livelihood options for local communities.

Community consultations

This solution is being implemented through the regional programme Coping with Climate Change in the Pacific Island Region (CCCPIR), a joint initiative of the Secretariat of the Pacific Community (SPC), the State of Yap, the national government of the Federated States of Micronesia and Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ) on behalf of the German Federal Ministry for the Economic Cooperation and Development (BMZ).

The Yap Department of Resources & Development Director comments:

“I am very happy about how CEAFM has turned out in Yap. The Fish Aggregating Devices activity has provided the general public not only the choice for alternate food and income source, but also the opportunity to look at how other activities may help and promote the management of our marine resources and our communities simultaneously not only for the future but today as well.”

FADs attract tuna and other pelagic fish making it easier to catch them

Federated States of Micronesia
Nasoata Island in Fiji belongs to the people of Nakorovou village. It was in 1970 when the villagers bought back the island that, during colonial times, belonged to coconut plantation owners. Today, people living on the island do not have to fight colonisers, but people from outside who access the island illegally and poach its resources in an unsustainable way.

Nasoata Island’s co-management is a solution that bridges biodiversity conservation and fishing rights through an effective management framework. It was developed in a consultative process, bringing together different stakeholders from the national, provincial and local level. The solution considers traditional fishing rights, modern monitoring and law enforcement techniques.

The management plan will enhance the chances of Nasoata being chosen as the second Ramsar site in Fiji, meaning that it might become a certified Wetland of International Importance. The application is on-going.

Mr. Seru Serevi, renowned artist and composer in Fiji and the South Pacific region:

“Nasoata is important to us because it is our ‘ikanakana’, meaning our breadbasket, where we get our crabs and fish from. We have in our own ways been protecting the natural resources on the island, such as declaring taboo zones for certain periods and this has contributed to the pristine state of the mangroves to date. Our people have respected the need to protect the island, it is people from outside who are not respecting our taboos. Through the consultative process we went through, strong cooperation between the villagers, the Provincial Office and the relevant government departments is now evident. The future of Nasoata is brighter. The protection of Nasoata, the inclusion into Ramsar and also the addition of some eco-tourism activities will be the best outcome for the island.”

Providing the scientific and legal evidence base
National plans and policies relating to mangrove management are reviewed and integrated into the development of an adequate management plan. Biodiversity assessments provide the scientific basis for the plan.

Facilitating multi-input management plan
Government authorities, conservation groups, community and international stakeholders jointly develop a co-management plan that protects the island and its fragile resources.

Repeated community consultations
Repeated consultations with relevant government departments, the provincial authorities, researchers and the local community are important to reach agreement on management practices desirable to all stakeholders. They also help to understand island dynamics and structures like the land tenure systems.

Witnessing challenges and visualising solutions
Relevant stakeholders witness and discuss existing challenges and possible solutions for a more sustainable use and extraction of the island’s resources on site.

Ensuring endorsement of end-product
The community endorses and the paramount chief of the province approves the management plan. This ensures adequate engagement for the implementation of the plan.

Seeking international management status
The management plan enhances the chances of Nasoata being chosen a Ramsar site, a certified Wetland of International Importance.

This solution is being implemented by the MESCAL project - a joint initiative of the Department of Environment, Fiji, the University of the South Pacific and IUCN.
In India’s state Tamil Nadu almost half of the population lives in coastal areas and depends heavily on the resources that the coast provides. However, these resources are at risk due to a number of climatic and non-climatic stresses, such as cyclones, floods, land and groundwater salinity, water pollution, or siltation of creeks in mangroves. This solution helps to turn saline areas into productive land again by introducing brackish-water fishing farming. This in turn helps to secure people’s incomes and livelihoods and to reduce migration to urban areas. Integrated Mangrove Fishery Farming includes building ponds and bunds, planting mangroves and halophytes on the bunds and introducing new salt-tolerant fish and plant species. What makes this solution “integrated” is not only the fact that it combines income generating activities with protection measures, but also that it is science-based and community-centred at the same time.

**Village level institutions**
These local management committees develop rules, regulations and micro plans for all activities and are responsible for their implementation. They try to consider the concerns and priorities of different stakeholders. Training allows them to also take into consideration new climate change findings.

**Situation analysis and vulnerability assessment**
Participatory rural appraisals help to draw a picture of the socio-economic and environmental situation and to identify the project area and risk zones that are affected most by climate change impacts like sea level rise and salinity.

**In India’s state Tamil Nadu almost half of the population lives in coastal areas and depends heavily on the resources that the coast provides. However, these resources are at risk due to a number of climatic and non-climatic stresses, such as cyclones, floods, land and groundwater salinity, water pollution, or siltation of creeks in mangroves. **Indrani Pahri Samy, living in a coastal village in Tamil Nadu:**

“Fishing was never easy for us. Very often we used to spend the whole day submerged in creeks or mangroves to hand-pick fish and crab. And very often this caused health problems like wounds in legs and hands, skin diseases, colds or fever. Plus, our fish catch decreased with time. With this project, things have become better. We set up a nursery, raised mangroves and planted them along the bunds and mounds of the ponds that we created. Today, I can earn money by selling fish which grows in our pond again since we use salt tolerant fish varieties now.”

**Villagers planting mangroves that were grown in the village nursery. The mangroves provide protection against upcomming cyclones and other natural disasters.**

**Participatory monitoring**
A team of representatives of the target community, non-governmental organisations and government agencies monitors the progress of all activities. If necessary, plans and activities are adapted.
This solution was implemented by the West Bengal University of Animal and Fishery Sciences (WBUAFS) and the World Wildlife Fund (WWF) India in cooperation with GIZ’s project Climate Change Adaptation in Rural Areas of India (CCA RAI), on behalf of the German Federal Ministry for Economic Cooperation and Development.

**Adaptation Centre**
This centre provides broad information on climate change adaptation and serves as a nodal point for disaster response teams. Data and experiences that are collected here are made accessible to all community members and different agencies.

**Vulnerability assessment**
This assessment helps to identify the physical and socio-economic vulnerabilities of the island’s communities and to locate low-lying areas that are particularly prone to coastal flooding. It aims to identify appropriate salt-tolerant species, data on soil and salinity is collected.

Since 1969, Mousuni Island in the Indian Sundarbans has shrunk by one sixth due to coastal erosion. In the same time the island’s population has tripled. With breaches in the island’s embankments, saline water keeps flowing onto the mainland. Especially before and after the monsoon, when most of the storms occur, vast areas of the island are under water.

With the expected sea level rise, the threat of damage to agricultural land, property and human and animal life will most likely increase. This solution prepares island communities for an uncertain future, enabling them to adapt to climatic changes. Its two core activities are preparing people for extreme weather events and disasters and introducing suitable salt-tolerant paddy and fish varieties in flood prone areas.

**Wilted paddy**

**Disaster preparedness training**
Capacity building of community members and the formation of disaster response teams enable people to better cope with disasters. The disaster response teams consist of young local volunteers who are trained and well equipped to act on relief and rescue operations before, during and after an emergency.

Adequate co-management institutions
Local communities manage the Bird’s Head Seascape. Community leaders are trained in the protection and sustainable use of marine resources.

This solution is being implemented by Conservation International (CI), The Nature Conservancy (TNC) and the World Wildlife Fund (WWF) Indonesia.

Lukas Rumetna, the Bird’s Head Portfolio Manager at The Nature Conservancy:

“After years of building the skills and commitment of the people in West Papua, they are now ready to continue the conservation efforts on their own. Most of them have understood their important role in managing Marine Protected Areas and have been equipped with the necessary know-how. There may only be a few tasks remaining that still need our assistance. Once we have left, local people will work together with the technical control unit from the local administration that will replace our work here.”

The network includes 15 Marine Protected Areas and covers over 3.6 million hectares of critical coastal and marine habitats. It aims at preserving the Seascape’s globally significant biodiversity while at the same time ensuring food security and sustainable economic benefits for local communities. A co-management approach integrates modern and traditional community management systems, thus strengthening the rights and capacities of local communities to manage marine resources within their own unique cultural context.

Science-based management
Scientific investigations provide a clear understanding of the seascape and are the basis for its management. They include natural and social science as well as the rich traditional knowledge of the local people.

Co-management planning
Extensive consultations with local community leaders, governmental and non-governmental agencies provide the basis for a management plan that is, in a second step, approved by the responsible government ministry.

Social and political support and partnership
Innovative outreach and communication strategies build social and political support as well as trust and ownership among communities. This leads to reliable collaboration between international and local partners.

Sustainable financing
A combination of government allocations, tourism user fees, payment for ecosystem services and a multi-sector capitalised conservation trust fund cover all core MPA management costs.

Private sector engagement
Tourism in the Bird’s Head Seascape is developed together with the tourism industry and with a focus on eco-tourism. A tourist user fee system supports marine conservation and community development.
In many spatial planning processes, the use of land and marine areas is treated separately, which often leads to conflicts in economic use and environmental protection. This applies especially for areas that are highly populated and intensively used. Bontang City in Indonesia is such an area. The coastal zones around Bontang City feature human settlements, power plants, oil and gas industries, ports, aquaculture, marine transportation, fisheries and tourism.

In order to prevent the degradation of biodiversity and ecosystems around Bontang City and to address existing and potential spatial conflicts in an adequate and effective way, a number of mid-level government officials initiated the development of an integrated spatial plan. This new plan, for the first time, includes both land areas and marine areas with its mangroves, coral reefs and seagrass beds. It is the first example of the implementation of the Indonesian Law No 26/2007 on Spatial Planning and Law No 27/2007 on Coastal Area and Small Islands Management to be applied in coastal districts/cities in Indonesia.

Dr. Ario Damar, Vice Director for the Natural Resources and Environmental Program at the Center for Coastal and Marine Resources Studies – Bogor Agricultural University:

“This approach that synchronises land, coastal and marine spatial planning is novel for us. It was initiated by a group of young and enthusiastic middle level governmental officials of Bontang City who were partly trained in Integrated Coastal Zone Management and were keen to introduce and apply it. Very consciously we selected representatives from various other relevant stakeholder groups, people who were open minded and willing to cooperate. Together with them and the government officials we were then able to develop the new integrated spatial plan. I think having this human capital and openness for new experiences was the main pre-condition for the successful development of this new ‘solution’ that may even serve as a model for other coastal districts in Indonesia.”

Multi-sectoral stakeholder committee
Key persons from all stakeholder groups, including governmental staff, discuss spatial conflicts in a series of meetings and agree on a zonation scheme.

Ecosystem-based spatial analysis and planning
Environmental and socio-economic profiles of the coastal zone are analysed. Based on ecosystem-based management principles, land, coastal and marine systems are integrated into one single spatial plan.
In the western corner of the Coral Triangle biodiversity hotspot, off the coast of Bali, Indonesia, lie the islands of Nusa Penida, Nusa Lembongan and Nusa Ceningan. The islanders and coastal fishers from Bali derive their livelihoods from the rich surrounding seas through fisheries, seaweed farming and marine tourism. Nusa Penida’s waters support a rich marine life, such as the peculiar Ocean Sunfish (Mola mola) and Manta Ray (Manta birostris).

The Coral Triangle Center (CTC) has been closely involved in the establishment and management of a locally-managed marine protected area (MPA) in Nusa Penida. Acknowledging the site’s collaborative governance model, which aligns benefits for all stakeholders with marine biodiversity conservation and is therefore an example for the whole region and beyond, CTC has developed Nusa Penida into a learning site. The establishment and collaborative governance of Nusa Penida MPA has shown immediate positive effects on the recovery of fish stocks and reef health while ensuring high acceptance of the site by the community. Illegal fishing practices, such as cyanide and blast-fishing, have been virtually eliminated.

Coral Triangle Center (CTC) executive director Rili Djohani: “Nusa Penida has become a jewel in Indonesia’s marine protected area system, as one of the most thoroughly planned and zoned MPAs in the Coral Triangle through bottom-up collaborative management that contributed to people’s livelihoods and economies while protecting the world’s biological wealth for future generations.”

**Baseline data collection**
Scientific data with input from relevant stakeholders is collected and documented through a series of surveys, interviews and discussions. This helps to determine criteria for establishment of protection zones and acts as input for discussions with local stakeholders.

**Zoning and management plan**
Formalize and enhance local customs and institutions legally. Conduct a series of consultations with all stakeholders, including local government, fishermen, tribal council, seaweed farmers and dive operators. Identify core zones of high resilience, thus high conservation value, as well as clear direction for long-term management of MPA.

**Collaborative management body scheme**
Establish a management body including all stakeholders reflecting the collaboration between local governments ensuring transparency and accountability. Set up joint patrol, biophysical and resource monitoring teams with members of all stakeholder groups.

**Ecological restoration**
Rehabilitation of mangroves enhances climate change resilience by protecting the island from rising sea level and heavy storm impacts and increases sequestration of carbon.

**Sharing experiences**
Provide a platform for training and field visits. Train staff and key stakeholder representatives. Conduct review sessions for customisation and quality control.

**Sustainable financing mechanism**
Develop a formalised entrance fee system for marine tourism. Apply concept of ‘sharing program, sharing costs’ to individual stakeholders for joint activities. Develop tourist attractions such as mangrove tours and ‘adopt the coral’ program which are managed by and financially benefit the community. Ensure active support of dive tour operators to avoid adverse impacts of visitors.

© Keith Ellenbogen

This solution is being implemented by the Coral Triangle Center (CTC) in cooperation with the International Union for Conservation of Nature (IUCN).
This solution is being implemented by the Ministry of Natural Resources, Environment and Tourism of Palau in cooperation with the Palau International Coral Reef Center (PICRC) and other NGOs. It has been awarded the Future Policy Award by the World Future Council.

The Palau Protected Areas Network (PAN) Act provides the legal basis to establish a network of protected areas. It empowers communities to designate and manage marine and terrestrial protected areas in cooperation with governments, NGOs and other partners. The act outlines standards, criteria, application processes, technical and sustainable financial assistance for management and monitoring of sites. The Protected Area Network Fund is sourced from visitor fees and directly supports participating local communities. The PAN Act has been recognized as an exemplary policy through the Future Policy Award by the World Future Council.

The communities of Ngarchelong and Kayangel started cooperating in the early 1990s on conservation and resource management. In 2012, they joined the Palau Protected Areas Network (PAN) to improve management and enforcement of their protected areas.

Chief Urachetae Victor Joseph of Ngarchelong
«Our land areas are small, so our livelihoods must extend to the sea and we need to ensure resources continue to be abundant. Stewardship begins with us, and PAN is our major enabler.»

Chief Rdechor of Kayangel:
«Traditionally we used to cooperate. With this renewed cooperation, made possible by PAN, we have the opportunity to solve many issues facing us, especially, in dealing with climate change, sea level rise and coral threats and fish declines that undermines our livelihoods.»
Networks of marine protected areas (MPAs) are considered a key tool for fisheries management, biodiversity conservation and strengthening of coral reef resilience. The effectiveness of MPA networks significantly increases if MPAs are ecologically connected, for example by situating the protected areas to facilitate the linking of marine populations through dispersal of fish and coral larvae. Although the understanding of ecological connectivity is crucial for the establishment of MPA networks, little is known about connectivity patterns.

This solution provides for the first time scientific data to better understand ecologically relevant larval dispersal of reef fishes in the Philippines. Genetic data analysis revealed that locally-managed MPAs situated along a 90 km coastal stretch in the province of Negros Oriental can supply reef fish larvae to fellow MPAs and to areas open to fishing. The derived knowledge on larval dispersal patterns helps stakeholders to improve existing MPA networks or to efficiently plan new networks that may even cross political (municipal) boundaries.

Dr Rene A. Abesamis was the main investigator of the larval connectivity study that was carried out at the Silliman University, Angelo King Center for Research and Environmental Management. He and his colleagues worked with local stakeholders in eight municipalities in Negros Oriental during the scientific study. They shared their findings with local government officials, government agencies and representatives from people’s organisations, the education sector and other stakeholder groups. In workshops with stakeholders before and after the study they explained the concept of larval connectivity and why knowledge of larval dispersal patterns is crucial for determining the size, spacing and location of individual MPAs within a network. In 2013, Dr Abesamis was awarded as an outstanding young scientist by the National Academy of Science and Technology for both his research and his endeavors to share his findings and transfer knowledge.

Scientific investigation on larval dispersal
Parentage analysis using microsatellite DNA markers is used to expose links between reef fish populations via larval dispersal and the extent of ecological connectivity between different MPAs.

Communication of scientific results
Findings on larval connectivity are communicated to local stakeholders, decision-makers and the scientific community to improve the efficiency of existing and future MPA networks and its governance.
In the Philippines, like in many other places, fish stocks are decreasing as a result of marine and freshwater habitat destruction. This solution addresses insufficient and ineffective fisheries management to improve income and livelihood for small-scale fishers – by setting up Fisheries and Aquatic Resource Management Councils (FARMCs).

These FARMCs are composed of representatives from local fishermen, government, academia, civil society and private sectors and serve as a legal forum to jointly discuss and decide solutions for the sustainable use of municipal marine and other aquatic resources. They give resource users a legal status and actively involve them in all management and decision making processes.

Arturo Maristela, former mayor of Aroroy, a municipality in the province of Masbate:

«Because of the creation of the FARMC, the fisherfolk’s perspective towards their resources was challenged, provoking a changing of mind-set that gives more respect towards their resources, and establishing a sense of ownership and responsibility.»

When a fisherman in the Philippines claims, «Our government cannot manage our coastal resources on its own, it needs us fisherfolk. We are part of the solution,» he will most likely be a member of a FARMC. These local councils have empowered fisher folk who had felt helpless and abandoned by their government but are now recognized for their significant contributions in coastal and fisheries resources management.

This solution was implemented through FARMC Project Philippines funded by the Lighthouse Foundation in selected pilot sites in support to the national programme for FARMCs of the Department of Agriculture-Bureau of Fisheries and Aquatic Resources.
MANGROVE CONSERVATION AND REHABILITATION

Mangroves and beach forests provide coastal greenbelts that act as a protective buffer against sea level rise and storms. Moreover, they are particularly effective in mitigating global warming and rising carbon dioxide levels by capturing and storing carbon in both above- and below-ground biomass.

This solution empowers people on Panay Island in the Philippines to protect remaining mangrove forests and rehabilitate lost forest sites with suitable mangrove species. Abandoned fish ponds, in particular – many of which used to be mangrove sites – are turned back into healthy mangrove forests. The sound scientific base for rehabilitation and pond reversion ensures their success.

Dr Jurgenne Primavera, leading scientist in mangrove conservation:

"The inland mangroves of Bugtong Bato-Naisud in Ilojaj, Aklan Province of Panay Island, boast of 27 true mangrove species. The jewel in its crown is a magnificent stand of centuries-old Avicennia rumphiana, the biggest of which is a 20-meter tall tree with a girth of nine meters. The forest is full of birds, fiddler crabs, mud skippers and mud lobsters, called the engineers of the mangroves because of their mound-building activities. The discovery of this patch of mangrove in 1996 was followed by intensive research over the next ten years, which was documented in various scientific publications. The construction of a 1,000-meter foot walk started in 2008 with funds from my Pew Fellowship in Marine Conservation. The next year, it was completed by the local government in collaboration with the Zoological Society of London. The 44-hectare huge Kantunggan Lt Ilojaj Eco-Park was inaugurated in 2010. Since then, thousands of national and international tourists, students, researchers and others have visited the park. My fondest hope is that all Filipinos will have the opportunity to visit and appreciate this marvellous, magical forest and its wildlife."

Dr Primavera teaching about mangroves

© ZSL, A. B. Lopez

Seafront mangrove planting
Trained local communities rehabilitate lost forest sites, in particular vulnerable seafronts, using science-based methods.

Reversion of abandoned ponds to mangroves
An inventory of all fishponds is generated and fed into a central database to determine tenurial status. Planting trials identify the most effective methods for pond-mangrove reversion.

Mangrove eco-park
The eco-park is a means of protecting remaining mangrove forests and also helps to raise awareness of the importance of mangroves, while providing valuable additional income for the local communities who manage the park.

© J.H. Primavera

This solution is being implemented by the Zoological Society London (ZSL) in cooperation with GIZ’s project Adaptation to Climate Change in Coastal Areas (ACCCoast) on behalf of the German Federal Ministry for the Environment, Nature Conservation, Building and Nuclear Safety (BMUB).
This solution is being implemented by Conservation International (CI) in collaboration with the provincial government of Oriental Mindoro and city government of Calapan.

Mangrove ecosystems provide livelihoods and coastal protection. They also have a high carbon sequestration and storage potential and thus contribute to climate change mitigation. And yet, mangroves are being cleared at an alarming rate. In the Philippines over 50 per cent of mangroves have already been lost.

Community-based mangrove rehabilitation addresses the degradation of coastal greenbelts by enabling and empowering people to protect remaining mangroves and reforest degraded areas. In order to make protection, rehabilitation and management measures sustainable, this solution also stimulates income diversification and offers capacity building for communities.

SNPS is working to diversify income from mangrove conservation and planting to micro-enterprise projects ranging from ecotourism to the sale of souvenirs. CI and the provincial government of Oriental Mindoro funded the construction of a 400-meter mangrove boardwalk, where visitors can experience the vast expanse of the mangrove forest. A look at Facebook shows that the eco-tourism concept and the crash course in nature conservation for tourists work well. Students and teachers, government officials and foreign journalists, and even beauty queens have posted their encounters with the "paradise island of mangroves" on the project’s Facebook account.

Social Marketing Lite is a solution that uses private sector marketing tactics to inspire people to change their behavior. In the coastal areas of the Philippines this solution is applied to support people protecting their environment.

A main focus of Social Marketing Lite is to build social marketing capacities among local government units and to improve their governance of marine protected areas through community participation.

This solution can be applied within one year and needs as little as 5,000 US dollars of financial input. Social Marketing Lite therefore can be seen as a cost-efficient model for increasing community engagement in the governance of marine protected areas and for fostering climate change resilience of coastal ecosystems.

On Suyac Island one can see the difference that Social Marketing Lite makes. The 1.8 hectare island with a population of 751 people is inhabited mainly by fisherfolk. Although the island has pristine mangrove resources, until lately the people of Suyac were not aware of their rich environment and its importance to people's livelihood. They were unaware that some of their practices were environmentally destructive. They used to uproot mangroves or practiced dynamite fishing or fish poisoning. Along with the decision to establish eco-tourism on the island, Social Marketing Lite was introduced to trigger behavioral change. A people’s organisation composed of island residents was established to manage the emerging eco-park. Another activity that proved highly efficient on Suyac Island was the training of young children in mangrove protection, waste segregation, public speaking, and tour-guiding. Today, these young “eco-patrollers” act as advocates for coastal resource conservation on their home island.

Social Marketing training
A series of workshops trains participants in social marketing concepts and techniques. This enables them to develop and implement their own campaigns in their communities. The exchange of experiences through cross-visits supports the learning process.

Community mobilisation
Activities and events raise awareness and gain support from the larger community for environmental protection.

Small grants
Funding to produce materials and conduct community mobilisation events is provided through small grants.

This solution is being jointly implemented by the non-governmental organisation Rare and GIZ’s project Adaptation to Climate Change in Coastal Areas (ACCCoast) on behalf of the German Federal Ministry for the Environment, Nature Conservation, Building and Nuclear Safety (BMUB).
In the Philippines, small-scale fisheries play a critical role in the livelihoods of coastal communities, and also contribute significantly to the national economy by supplying the bulk of the dietary fish requirements and providing direct employment. However, the failures and inadequacies in governance of small-scale fisheries are conspicuous: depleted fish stocks and degraded fish habitats, intensified resource use competition and conflict, post-harvest losses, limited institutional capabilities, inadequate and inconsistent fisheries policies, and weak institutional partnerships.

To address these problems, an Ecosystem Approach to Fisheries (EAF) was adopted by eight coastal municipalities in the Province of Misamis Occidental in Northern Mindanao, Philippines, to improve small-scale fisheries management for poverty reduction. These municipalities founded the Iligan Bay Alliance of Misamis Occidental (IBAMO), a multi-stakeholder body which provides a governance framework for inter-municipal collaboration in the province. IBAMO seeks to create opportunities that foster the well-being of both the environment and the people who depend on fisheries for their livelihood by developing EAF strategies and action for fisheries management and by strengthening the capacity of local fishery stakeholders and government agencies to collaborate and work according to EAF.

The formation of IBAMO is based on previous programmes in the field of coastal resource management in the province of Misamis Occidental. Thus, building partnerships and consensus with “outside” institutions (including NGOs and civil society groups) and catalyzing the improvement of fisheries governance at the target sites was achieved within two years. In 2012, all eight LGUs entered and signed a new Memorandum of Agreement with the provincial government and regional offices of several government agencies.

Since its establishment, IBAMO increases the commitment to implement EAF in small-scale fisheries management through better understanding of its potential for poverty reduction and environmental sustainability, integrates EAF in existing Coastal Resources Management plans and enhances the understanding of the roles of marine protected areas. The alliance fosters active participation and capacity development of beneficiaries in participatory research and collaborative implementation of EAF strategies and produces practical guidelines for EAF action programs and policy recommendations for long-term planning.
This solution is being implemented by the Tubbataha Management Office (TMO).

**Participatory development of the Act**
A series of multi-stakeholder consultations and workshops for drafting and reviewing the Act ensures full stakeholder participation as well as broad acceptance and compliance with rules and regulations.

**Information campaigns**
To promote awareness and a general understanding of the global significance of this biodiversity hotspot, the developed Act and policies are communicated to the public through various outreach activities, e.g. through radio plugs and local newspapers.

**Locally-based park management and law enforcement**
Local institutions and communities, municipal and national government representatives, NGOs, academia, and the private sector are all represented in a locally-based park management and law enforcement body. Law enforcement is ensured through partnerships with the Philippine Navy and Coast Guard and locally recruited park rangers who receive in-depth training and appropriate surveillance equipment. The environmental situation in the park is monitored regularly, while the effectiveness of governance is measured annually using participatory mechanisms.

**Financing park management**
The Tubbataha Reefs Natural Park is run with financial assistance from a range of sources. Conservation fees paid by visitors are the main source of funding. Grants from NGOs and the private sector make up 32% of the budget.

**Economic incentives for communities**
Local communities are compensated for economic losses caused by no-take policies. A share of the conservation fee is channelled into a livelihood fund that provides loans for development.

**USS Guardian aground at Tubbataha Reef**

In 2013, a US Navy warship ran aground at Tubbataha Reef. It damaged an area of 2,345.67 square metres. The vessel had to be removed from the reef in segments. The vessel had to be removed from the reef in segments. The USS Guardian aground at Tubbataha Reef.

The Tubbataha Reefs Natural Park is a UNESCO World Heritage Site.
About 26,000 people live in Choiseul Province, or Lauru by its local name, in the Solomon Islands. Due to its remoteness, people in Lauru depend heavily on natural resources for food and income. The area boasts the largest remaining stands of lowland rainforest and more plant and animal species than any other island in the Solomon archipelago. Its unique marine biodiversity calls for preservation—a task that the Lauru Ridges to Reefs Protected Area Network takes care of.

The Lauru Ridges to Reefs Protected Area Network is the first locally managed marine area network in Melanesia. The network helps to strengthen the ownership and responsibility of local communities. It provides them with a systematic approach and useful tools to develop their own conservation plans, so that they can create protected areas and achieve legal security over access rights.

Jimmy Kereseka, member of the Lauru Land Conference of Tribal Community (LLCTC):

> LLCTC is the representative organisation of the collective chiefs of all communities in Lauru. It was established in 1981 and has given the people of Lauru a strong voice. A couple of years ago we decided to join forces in order to make more wise and informed choices about our future—which is especially urgent given the pressures from logging, rising water levels, decreasing natural resources and increasing exploration by mining companies. Therefore, in 2008 LLCTC together with the provincial government requested support from The Nature Conservancy in order to better protect the land and seas of Lauru. The result was a provincial master conservation plan. This plan has been the foundation for the development of the 18 marine and terrestrial protected areas that have been established in Lauru so far.

Rich in natural resources: Lauru in the Solomon Islands

Development of the conservation plan with the help of 3D modelling

Conservation plan built on local and scientific knowledge

Through a participatory process, all relevant stakeholders map key features, cultural heritage and ecosystem services. MPA planning software identifies options for cost-effective protected area networks. 3D modelling is used to link local knowledge and scientific findings.

Integration of protected area sites into network

Once the conservation plan, the sites’ conservation value and the community’s commitment are approved by LLCTC, a new site is added to the Lauru network. A management committee formed by the community oversees and manages the new protected area.

Monitoring of protected areas

The community’s management committee ensures continuous monitoring of protected areas. Interested community members are trained in monitoring using standardised techniques.

Overseeing implementation of the network

An overall committee made up of representatives of all stakeholders meets twice a year to review the implementation and progress at different sites in accordance with the conservation master plan.

Alternative livelihoods

Where feasible, LLCTC explores options of developing alternative incomes in order to counter possible negative impacts of resource use limitations. Eco-tourism or eco-timber (including honey bee projects) are such alternatives.

This solution is being implemented by Lauru Land Conference of Tribal Community (LLCTC), the Government of Choiseul province and The Nature Conservancy (TNC)
Green Fins: Responsible Diving

Tourism accounts for a third of the economic value of coral reefs. Tourism is also of increasing importance for developing countries but constitutes a significant pressure on coral reefs. The diving and snorkelling industry is one of the fastest growing tourism industries. What is good for business often creates threats for nature – in this case for marine ecosystems and in particular for coral reefs in tourism hotspots worldwide. This solution targets these threats. The Green Fins approach provides guidance to environmental standards for dive operators thus creating more responsible and sustainable behaviour within the industry. It offers simple and economic recommendations to prevent hazards like anchor damage or littering. In order to sustainably conserve and protect coral reefs, private and public sector stakeholders are brought together and collaborations are encouraged to create a network for awareness.

This is how dive centres get involved: dive centres agree to become members. This is voluntary and free of charge. A trained Green Fins assessor then carries out an assessment and the dive centre agrees on three realistic actions it can commit to that will limit its environmental impact and improve environmental awareness and eco-friendly dive operations. Depending on the success of these actions, dive centres have the possibility to become one of the top members. If, after two yearly assessments, no improvement is recorded, free membership can be suspended or withdrawn from the member. This is a valuable quality control tool because members and above all the most eco-friendly operators get free publicity – on the Green Fins website, on social media, or at international dive shows.

Multi-stakeholder partnerships for eco-friendly diving
Public and private sector partnerships are initiated to build management capacities and shape regulatory frameworks for a more sustainable diving industry.

Code of conduct
This code outlines 15 actions that target environmental threats caused by the dive industry both on land and under water. The guidelines help dive centres and individual divers to reduce their impact on reefs by providing clear industry standards for environmentally responsible practices and promoting marine environmental awareness.

Environmental assessment of dive centres
Dive centres that are willing to implement environmental standards can be certified based on the Green Environmental Assessment Rating System (GEARS) used to evaluate the day-to-day practices of dive and snorkel centres against set criteria. Certification and free publicity are efficient incentives for eco-friendly dive tourism.

This solution is being implemented by Green Fins – a joint initiative of the Reef-World Foundation and United Nations Environmental Programme (UNEP).
Coastal areas are extremely vulnerable to the impacts of climate change, and it is necessary to respond to these threats and attempt to minimize the vulnerability of coastal ecosystems and communities. Spatial planning is a tool to integrate measures to incorporate climate change into planning processes. It is not a new concept in the East Asian Seas Region. In fact, spatial planning has been employed for decades in member countries of the East Asian Seas Region. However, existing planning systems often do not include climate change and sea level rise scenarios or modern management approaches.

This solution is an initiative in the East Asian Seas Region that provides capacity building for national and local authorities responsible for coastal development and management and in particular for coastal spatial planning. It integrates emerging issues and new management approaches into existing planning concepts. The solution also provides national adaptation activities tailored to the needs and priorities of each country as well as best practices for capacity building and field applications.

**Regional resource document**

This document describes management approaches in existing spatial planning systems, and outlines applications of the general spatial planning process at different scales, administrative levels and degrees of complexity.

**National resource document**

This document provides information, case studies and examples of all aspects of coastal spatial planning to inform local or national planning processes. It provides orientation to local planners, researchers, students, and national authorities.

**Capacity building**

Regional and national trainings that are tailored to the needs and priorities of the participating countries and compliant to the respective regional and national resource documents build capacities of national and local authorities. These trainings prepare authorities to integrate spatial management approaches into their national planning processes.

**Strengthening capacities in Cambodia**

Based on the regional and national resource documents and trainings, a six-month demonstration activity was conducted with the aim of enhancing the knowledge and capacity of Cambodian local authorities on coastal spatial planning. This was done through hands-on demonstration and development of coastal planning scenarios considering ecosystem-based adaptation (EBA) and disaster risk reduction (DRR). During the trial two things were developed with participation of local authorities and communities: a spatial planning strategy for EBA and DRR, and an outreach document in non-technical language with illustrative graphics of EBA and DRR scenarios including the role of mangrove and coastal ecosystems for climate change mitigation and adaptation. The spatial planning strategy and the outreach document are now used by Cambodia in their planning activities.

**Regional training course on coastal spatial planning, Thailand**

This solution is being implemented by the Coordinating Body on the Seas of East Asia (COBSEA) of the United Nations Environment Programme (UNEP) and the Swedish International Development Cooperation Agency (SIDA).
In the countries of the East Asian Seas Region the speed of coastal erosion, exacerbated by climate change, increases year by year, threatening coastal ecosystems, communities and economies. In most countries comprehensive strategies to cope with coastal erosion are missing so far.

The “COBSEA Regional Programme for the Sustainable and Ecosystem-Based Management of Coastal Erosion in the East Asian Seas Region” responds to policy and operational gaps in order to address coastal erosion in six countries in the East Asian Seas Region: Cambodia, Indonesia, Malaysia, Philippines, Thailand and Vietnam. National authorities assess gaps and needs in their respective countries and identify priority actions for addressing coastal erosion. Results and recommendations are presented in national reports, that are discussed and agreed upon through a national consultation process with all stakeholders.

Ms Morin, Under Secretary of State of the Ministry of Environment of Cambodia, during her opening remarks at the national consultation meeting in Cambodia:

“This solution is being implemented by the Coordinating Body on the Seas of East Asia (COBSEA) of the United Nations Environment Programme (UNEP) and the Government of the Republic of Korea through the Korea Maritime Institute (KMI), the Ministry of Land Transport and Maritime Affairs (MLTM) and the Korea International Cooperation Agency (KOICA).”
There are an estimated 400,000 hectares of abandoned shrimp ponds in former mangrove areas worldwide. These areas represent both environmental degradation and lost economic opportunities. There are many efforts to regenerate hydrologically disturbed or degraded mangrove forests. The success rate, however, is rather low due to a number of reasons, including failing to observe nature and planting the wrong species in the wrong place at the wrong time.

This solution, applied in the coastal Trang Province in Thailand, has shown that Community-based Ecological Mangrove Restoration can make a difference. It restores degraded and unproductive areas back to healthy and diverse mangroves at low cost and with community stewardship. The overall aim is to sustain livelihoods of fishers and resource users, to protect communities from disasters and last but not least to benefit the environment. This solution highlights the need to observe nature thoroughly first while allowing nature to do the seeding and rehabilitation by itself.

The activities in Thailand are part of the Mangrove Action Project (MAP) involving four countries in Asia and five non-governmental organisations. All project activities follow MAP’s five-pronged approach to mangrove conservation that involves education, advocacy, collaboration, conservation and restoration, and sustainable community-based development.
Aquaculture in Vietnam is dominated by brackish-water and freshwater production systems. The Mekong River Delta accounts for about 80 per cent of the country’s total shrimp production. Silvo-aquaculture is an extensive farming method that incorporates mangrove forest in aquaculture ponds. However, poor culturing techniques, a lack of capital and mono-cultures make aquaculture farms prone to calamities that may lead to periodical loss of profit. To supplement their income, farmers therefore often collect natural resources from adjacent mangroves, causing their degradation. By promoting Best Management Practices for silvo-aquaculture as well as supporting Farmer Interest Groups along the Mekong Delta coast, the solution aims at both awareness creation for mangrove ecosystem conservation and diversification of farmers’ incomes. It promotes ecological farming techniques and the integration of mangroves in shrimp ponds.

Through the application of Best Management Practices, the risks of crop failure and diseases are successfully reduced. Farmers’ incomes increase due to optimal species composition and non-aquaculture product diversification, juvenile selection, separated breeding and water control. The farmers are aware of the benefits of silvo-aquaculture, continuously improve these Best Management Practices and share them with others in neighbourly cooperation and farmer networks.

Promotion of Best Management Practices (BMP)
BMPs are promoted via theoretical and practical on-site trainings. Farmers use model trials to showcase BMP and to exchange experiences.

Farmer interest groups (FIG)
Neighbouring farmers meet regularly and work together to share information and best practices on diversified aquaculture production, to buy seedlings economically in group orders, and to grant annual farmer loans financed by a FIG membership fee.

Ecological farming techniques
Integrated silvo-aquaculture that incorporates mangrove forest in mixed-species aquaculture ponds is optimized in model trials to identify Best Management Practices (BPM) regarding species composition and stock density, water management, nursing and mangrove conservation.

Integration of mangroves in shrimp ponds

This solution is being implemented by the Department of Agriculture and Rural Development (DARD) and the Bac Lieu Experimental Station for Aquaculture (BLESA) in cooperation with Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ) on behalf of the German Federal Ministry for the Environment, Nature Conservation, Building and Nuclear Safety (BMUB).
In large parts of Vietnam’s Mekong Delta the rapid expansion of shrimp farming and the cutting of mangroves for income generation have boosted local economies and reduced poverty in the last decades. But unsustainable use of natural resources and the loss of mangrove forests have started to show negative impacts: incomes are decreasing, poverty is increasing again, and vulnerability to climate change has risen.

This solution can lead the way out of this vicious circle by aligning environmental and economic interests. It uses a more sustainable management approach called co-management that is based on shared governance, responsibility and accountability among all stakeholders involved.

Mr. Huỳnh Lâm Biên, member of a co-management group in the Mekong Delta:

Co-management has changed people’s attitudes towards both the environment and the authorities. "Before co-management was applied, we were afraid of the forest rangers, now we work together with them to protect our forest and resources." The simple logic of this change: people who have the rights to use certain natural resources have a natural interest in protecting them. However, it’s not only the communities who benefit from this new approach, but also the authorities. They now need less manpower and financial resources to protect the environment.

This solution is being implemented by the Department of Agriculture and Rural Development of Soc Trang Province in cooperation with Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ) on behalf of the German Federal Ministry for Economic Cooperation and Development (BMZ).
This solution is being implemented by Van Ninh district’s People’s Committee in Khanh Hoa province and the Centre for Marine Life Conservation and Community Development (MCD).

The bottom-up participative and adaptive locally managed marine area (LMMA) of Trazo Reef addresses environmental degradation, resource depletion, weakened management of coral reefs, and climate change adaptation for local fisherfolk. Based on the 2001 community request, the project, supported by the Provincial People’s Committee and the Center for Marine Life Conservation and Community Development, improved local ownership and management capacities as well as fish stocks.

Requirement assessment
Community and other stakeholders participate in all aspects of the management process. Enable community to conduct stakeholder consultation on LMMA zoning and management operations, using a 3D model of the site for visualisation.

Ecological restoration and site implementation
Establish no-take reef zone to prevent further loss of ecological values. Advance enforcement of LMMA regulations. Provide training for coral transplantation. Conduct regular underwater monitoring of resource recovery.

Establishing participative management
Adopt co-management structure, including enforcement of regulations by joint patrols. Transfer ownership of LMMA to local governance. Ensure legal status and governmental funding.

Fine-tuning site management
Legalise LMMA at district and provincial levels. Implement a two-year management plan with regular revision, monitoring and reporting of all stakeholders. Include adaptive management of livelihoods and needs. Mobilise additional funding.

Solution

Trazo Reef in Vietnam’s Khanh Hoa province faces destruction as already observed at neighbouring reefs due to unsustainable fishing, pollution through lobster and black tiger shrimp aquaculture, and climate change induced effects. The open access system and lack of a national legal framework and coordination renders responsibility and accountability of stakeholders ineffective. Thus, livelihoods of most households are at stake.

The recognition of the Trazo Reef as a marine protected area is not only a great sense of accomplishment and encouragement for community members who have contributed to the area’s protection, but is also an example of effective co-operation among three sectors—the local community, state management offices at all levels, and civil society—towards the common goal of protecting the environment and marine resources for future generations.

Requirement assessment
Community and other stakeholders participate in all aspects of the management process. Enable community to conduct stakeholder consultation on LMMA zoning and management operations, using a 3D model of the site for visualisation.

Ecological restoration and site implementation
Establish no-take reef zone to prevent further loss of ecological values. Advance enforcement of LMMA regulations. Provide training for coral transplantation. Conduct regular underwater monitoring of resource recovery.

Establishing participative management
Adopt co-management structure, including enforcement of regulations by joint patrols. Transfer ownership of LMMA to local governance. Ensure legal status and governmental funding.

Fine-tuning site management
Legalise LMMA at district and provincial levels. Implement a two-year management plan with regular revision, monitoring and reporting of all stakeholders. Include adaptive management of livelihoods and needs. Mobilise additional funding.

This solution is being implemented by Van Ninh district’s People’s Committee in Khanh Hoa province and the Centre for Marine Life Conservation and Community Development (MCD).
Along the mangrove-mud coasts of the Mekong Delta, erosion causes loss of land up to 30–90 m per year and affects the life of many thousands, often poor farmers and fisherfolk. The traditional response of building concrete dykes and seawalls does not work on the soft soils since the structures simply sink into the mud or collapse. In such situations, a coastal area protection strategy which combines floodplains (foreshore), mangrove forests and, where necessary, an earth dyke is the most effective solution. However, at sites where the foreshore and mangrove forest have been destroyed by erosion, such a strategy can only be implemented after restoration of the eroded floodplains. This will re-create the site conditions suitable for mangrove forest growth.

Mrs Sà Vong from the coast of Soc Trang Province, Vietnam:

In the past, Mrs Sà Vong and her family had a good life with catching fish, collecting clams and cockles in the mangrove forest and on mudflats in addition to income from her small fish pond. Then, the mangroves were destroyed due to many people having uncontrolled access to the fishing grounds. In such situations, a coastal area protection strategy which combines floodplains (foreshore), mangrove forests and, where necessary, an earth dyke is the most effective solution. However, at sites where the foreshore and mangrove forest have been destroyed by erosion, such a strategy can only be implemented after restoration of the eroded floodplains. This will re-create the site conditions suitable for mangrove forest growth.

This solution restores floodplains and mangrove forests as elements of an ecosystem-based approach to coastal protection at relatively low cost. Developed for the Lower Mekong Delta’s muddy coast in Vietnam, it provides security for people living directly behind dykes and supports their livelihood through income from small-scale fishing and aquaculture in mangrove and floodplain ecosystems.

This solution is being implemented by GIZ’s programme Climate Change and Coastal Ecosystems Program in the Mekong provinces for the Adaptation to Climate Change (ICMP/CCCEP) on behalf of German Federal Ministries.
This solution is being implemented by Cham Islands Marine Protected Area Authority.

Facilitating a co-management dialogue
The MPA management plan was developed using the co-management model including workshops and stakeholder meetings. Shared responsibilities and interests of the state, community, and stakeholders have been jointly identified.

Designing and zoning an MPA for climate adaptation
The MPA design followed an ecological systems approach to prioritize strictly protected areas, ecological restoration, tourism development, reasonable exploitation and development areas. Zone management allows for specific adaptive measures.

Establishing local management infrastructure
A coordinating centre sets up the Cham Islands MPA zoning plan and regulation roadmap. It supervises monitoring, conducts research, public awareness raising and education, and coordinates development of management regulation and alternative livelihoods.

Developing alternative livelihoods
The community-based eco-tourism homestay programme promotes socio-economic development and local income opportunities. The community-based land crab management programme promotes the sustainable exploitation of land crabs.

Conducting formal risk assessment
The risk assessment and the creation of Biosphere Reserve criteria lead to the delineation of the MPA in accordance to ecosystem and community needs.

Enabling stakeholder-driven patrolling and enforcement
MPA patrolling teams coordinate between different stakeholders, border guards, local police, fishery inspectors and communities to manage the marine resources in accordance with provisions for fishing on coral reefs and seagrass beds.

For the establishment of Cham Islands Marine Protected Area, an integrated and adaptive ecosystem management approach was applied by local people. Since 2006, the entire MPA is managed by a community organization. A community-based ecotourism home-stay program was developed, which provides job opportunities and improves local people’s standard of living. The recently established community-based land crab management programme was particularly innovative because residents agreed upon a protocol for sustainable management of the endangered land crabs. This programme has been enormously successful and has demonstrated the power of thoughtful and sustained community participation in environmental decision-making.
WATER AND FIRE MANAGEMENT OF A PEAT SWAMP FOREST

The conservation of Melaleuca trees has national priority in Vietnam because they buffer the effects of river floods, recharge aquifers and provide a unique environment for many wetland species of which a great number are endangered. The largest remaining stands of Melaleuca forest occur on peat soils – like in Vietnam’s U Minh Thuong National Park which is one of the country’s only two remaining peat swamp forests. However, from 2004 – 2009 the park’s Melaleuca trees and other species came under acute threat – mainly due to inappropriate artificial flooding to avoid fires.

This solution introduces appropriate water and fire management in the park with the aim to recover its natural conditions. Today, 3,900 hectares of the park’s unique peat swamp forests are protected and biodiversity is on the rise again. There is even more good news: the park’s peat preserves 2.7 million tons of carbon and the introduction of co-management leads to less incidents of looting, poaching and infringements.

Mr Luong Thanh Hai, Director of the Kien Giang Department of Science and Technology:

«Our new water management system that restores the wetlands to their natural condition through a system of gates, pump stations and canals and the new fire prevention system has helped us to bring the ongoing habitat and biodiversity loss in U Minh Thuong National Park to a halt. Bird species, including Melaleuca trees, are flourishing once again. Bird populations have increased by 3.3 per cent and nine new bird species have been recorded. Since we introduced our new management regime no major fires have been recorded which means we could also reduce the costs of firefighting extremely. There are also a number of positive social and economic impacts. To name but two: the park now provides a clean water source and supply of fish fingerlings into the waterways for about 10,000 people who live in the buffer zone.»

Multi-stakeholder workshop
Stakeholders from many different backgrounds discuss issues regarding biodiversity, water and fire management, and co-management for natural resources. The workshop group then decides on actions to be taken in the park and agrees on a reasonable timetable.

Water management
Efficient water management schemes for an appropriate flooding of different soils in peat swamp forests are developed and implemented. This includes infrastructure and capacity training of park staff.

Fire management
The newly introduced fire management includes the preparation of an investment plan, provision of adequate equipment and infrastructure for fire prevention as well as capacity training of park staff.
Building blocks are the essential elements determining the success of solutions. These building blocks may be adapted and recombined to address challenges in other contexts, sectors or geographies.

In this glossary we have listed all building blocks described in this publication. The building blocks are sorted by categories referring to their means of action and include reference to the solution they are part of.

</table>
39 Participatory Diagnosis and Adaptive Management (PDAM) | STRENGTHENING GOVERNANCE OF SMALL-SCALE FISHERIES
15 Providing the scientific and legal evidence base | NAGATA ISLAND CO-MANAGEMENT
39 Rapid Appraisal of a Fisheries Management System (RAFMS) | STRENGTHENING GOVERNANCE OF SMALL-SCALE FISHERIES
47 Regional resource document | STRENGTHENING CAPACITIES IN COASTAL SPATIAL PLANNING
37 Requirement assessment | COMMUNITY-INITIATED TRAD BEEF LOCALLY MANAGED MARINE AREA
21 Science-based management | COMMUNITY-BASED CONSERVATION AT SCALE – THE BIRD’S HEAD SEASCAPE
29 Scientific investigation on larval dispersal | CONNECTIVITY OF MARINE PROTECTED AREAS
17 Situation analysis and vulnerability assessment | INTEGRATED MANGROVE FISHERY FARMING
11 Understanding local impacts and threats | ADAPTIVE, COMMUNITY-DRIVEN AND RESILIENT CO-MANAGEMENT PLAN
35 Vulnerability assessment | MANGROVE REHABILITATION AND INCOME DIVERSIFICATION
19 Vulnerability assessment | PREPARING FOR DISASTER AND BUILDING LIVELIHOOD RESILIENCE

CO-MANAGEMENT BUILDING: development of institutional, legal, operational and administrative components for effective co-management, including community members and groups, governmental authorities at levels concerned, non-governmental organisations and partners, private sector and any other stakeholder

21 Adequate co-management institutions | COMMUNITY-BASED CONSERVATION AT SCALE – THE BIRD’S HEAD SEASCAPE
55 Co-management agreement | CO-MANAGEMENT OF MANGROVE FORESTS
21 Co-management planning | COMMUNITY-BASED CONSERVATION AT SCALE – THE BIRD’S HEAD SEASCAPE
59 Mangrove regeneration | ECOSYSTEM-BASED COASTAL PROTECTION THROUGH FLOODPLAIN RESTORATION
63 Multi-stakeholder workshop | WATER AND FIRE MANAGEMENT OF A PEAT SWAMP FOREST
55 Participatory consultation process | CO-MANAGEMENT OF MANGROVE FORESTS

COMMUNICATION, OUTREACH AND AWARENESS BUILDING: includes resource documents, translation of resource documents into other languages, sharing of experiences to disseminate best practices, cross visits to exchange experiences, specific events tailored to inform and change behaviour

19 Adaptation centre | PREPARING FOR DISASTER AND BUILDING LIVELIHOOD RESILIENCE
35 Capacity building | MANGROVE REHABILITATION AND INCOME DIVERSIFICATION
13 Community management plans | COMMUNITY-BASED ECOSYSTEM APPROACH TO FISHERIES MANAGEMENT

37 Community mobilization | SOCIAL MARKETING LITE
37 Ecological restoration and site implementation | COMMUNITY-INITIATED TRAD BEEF LOCALLY MANAGED MARINE AREA
53 Farmer Interest Groups (FIG) | BEST MANAGEMENT PRACTICES FOR SILVO-AQUACULTURE
41 Information campaigns | TUBBATAHA REEFS NATURAL PARK ACT
11 National upscaling and transboundary exchanges | ADAPTIVE, COMMUNITY-DRIVEN AND RESILIENT CO-MANAGEMENT PLAN
41 Participatory development of the act | TUBBATAHA REEFS NATURAL PARK ACT
53 Promotion of Best Management Practices (BMP) | BEST MANAGEMENT PRACTICES FOR SILVO-AQUACULTURE
15 Seeking international management status | NAGATA ISLAND CO-MANAGEMENT
25 Sharing experiences | MARINE PROTECTED AREA LEARNER SITE FOR THE CORAL TRIANGLE
21 Social and political support and partnership | COMMUNITY-BASED CONSERVATION AT SCALE – THE BIRD’S HEAD SEASCAPE

ENFORCEMENT: efforts leading to enforcement of laws, regulations and activities

27 Adaptive and participatory locally based management | PALAU’S PROTECTED AREAS NETWORK ACT
21 Co-management planning | COMMUNITY-BASED CONSERVATION AT SCALE – THE BIRD’S HEAD SEASCAPE
57 Ecological restoration and site implementation | COMMUNITY-INITIATED TRAD BEEF LOCALLY MANAGED MARINE AREA
61 Enabling stakeholder-driven patrolling and enforcement | SUPPORTING THE DEVELOPMENT OF THE RESILIENT ECO-CITY HO AH: THE CHAM ISLANDS MARINE PROTECTED AREA
59 Mangrove regeneration | ECOSYSTEM-BASED COASTAL PROTECTION THROUGH FLOODPLAIN RESTORATION
31 National FARMC programme management centre | FISHERIES CO-MANAGEMENT THROUGH FARMS

FINANCE SCHEME: includes micro finance plans and institutions, payment for ecosystem services schemes, other sustainable financing options such as entrance fees, funding support, financial incentives and offsets, diversification of funding sources, development of financial plan

41 Economic incentives for communities | TUBBATAHA REEFS NATURAL PARK ACT
41 Financing park management | TUBBATAHA REEFS NATURAL PARK ACT
27 Green fees | PALAU’S PROTECTED AREAS NETWORK ACT
21 Private sector engagement | COMMUNITY-BASED CONSERVATION AT SCALE – THE BIRD’S HEAD SEASCAPE
Glossary of Building Blocks

Small grants | Social Marketing Lite
Sustainable financing | Community-based conservation at scale – The Bird’s Head Seascape
Sustainable financing mechanism | Marine Protected Area Learning Sites for the Coral Triangle

Law and Regulations:
Includes codes of conduct, definition of user rights, drawing up legislation

Code of conduct | Green Fins: Responsible Diving
Participatory development of the act | Tubbataha Reefs Natural Park Act
Protected Area Network (PAN) | Palau’s Protected Areas Network Act

Monitoring/Evaluation/Overseeing Implementation:
Used to understand long-term development of interventions, to use measure progress and impact of project/activity

Continued collaboration between all stakeholders | Lauru Ridges to Reefs Protected Area Network
Fine-tuning site management | Community-initiated reef locally managed marine area
Locally-based park management and law enforcement | Tubbataha Reefs Natural Park Act
Monitoring | Ecosystem-based coastal protection through floodplain restoration
Monitoring of protected areas | Lauru Ridges to Reefs Protected Area Network
Overseeing implementation of the network | Lauru Ridges to Reefs Protected Area Network
Participatory monitoring | Integrated mangrove forest farming
Pluralistic co-management board | Co-management of mangrove forests
Rewards and incentives | Fisheries co-management through farms

Partnership:
Develop and/or strengthen (multi-stakeholder) partnerships and cooperation

Building consensus and formalizing the alliance | Strengthening Governance of Small-scale Fisheries
Collaborative management body scheme | Marine Protected Area Learning Site for the Coral Triangle
Pluralistic co-management board | Co-management of mangrove forests

Policy Advocacy:
Includes campaigns to get support from influential people, gain political support, identify and «use» champions

Building consensus and formalizing the alliance | Strengthening Governance of Small-scale Fisheries
National upscaling and transboundary exchanges | Adaptive, Community-driven and Resilient Co-management Plan

Stakeholder Dialogue:
Details various approaches to stakeholder consultation and involvement, including community engagement

Awareness campaigns | Preparing for Disaster and Building Livelihood Resilience
Collaborative management body scheme | Marine Protected Area Learning Site for the Coral Triangle
Communication of scientific results | Connectivity of Marine Protected Areas
Creating ownership | Adaptive, Community-driven and Resilient Co-management Plan
Facilitating a co-management dialogue | Supporting the Development of the Resilient Eco-city Hoi An: The Cham Islands Marine Protected Area
Inclusion of fisherfolk leaders | Fisheries Co-management Through Farms
Institutional arrangements | Preparing for Disaster and Building Livelihood Resilience
Integration of protected area sites into network | Lauru Ridges to Reefs Protected Area Network
Multi-sectorial stakeholder committee | Integrating Terrestrial and Marine Spatial Planning in Bontang City

Conservation agreement | Mangrove Rehabilitation and Income Diversification
Conservation framework | Mangrove Rehabilitation and Income Diversification
Establishment participative management | Community-initiated reef locally managed marine area
Multi-stakeholder partnerships for eco-friendly diving | Green Fins: Responsible Diving
Participatory consultation process | Co-management of Mangrove Forests
Partnerships and networks | Fisheries Co-management through Farms
Sharing experiences | Marine Protected Area Learning Site for the Coral Triangle
Social and political support and partnership | Community-based Conservation at Scale – The Bird’s Head Seascape

Law and Regulations:
Includes codes of conduct, definition of user rights, drawing up legislation

Sustainable financing | Community-based conservation at scale – The Bird’s Head Seascape
Sustainable financing mechanism | Marine Protected Area Learning Sites for the Coral Triangle

Policy Advocacy:
Includes campaigns to get support from influential people, gain political support, identify and «use» champions

Building consensus and formalizing the alliance | Strengthening Governance of Small-scale Fisheries
National upscaling and transboundary exchanges | Adaptive, Community-driven and Resilient Co-management Plan

Stakeholder Dialogue:
Details various approaches to stakeholder consultation and involvement, including community engagement

Awareness campaigns | Preparing for Disaster and Building Livelihood Resilience
Collaborative management body scheme | Marine Protected Area Learning Site for the Coral Triangle
Communication of scientific results | Connectivity of Marine Protected Areas
Creating ownership | Adaptive, Community-driven and Resilient Co-management Plan
Facilitating a co-management dialogue | Supporting the Development of the Resilient Eco-city Hoi An: The Cham Islands Marine Protected Area

Conservation agreement | Mangrove Rehabilitation and Income Diversification
Conservation framework | Mangrove Rehabilitation and Income Diversification
Establishment participative management | Community-initiated reef locally managed marine area
Multi-stakeholder partnerships for eco-friendly diving | Green Fins: Responsible Diving
Participatory consultation process | Co-management of Mangrove Forests
Partnerships and networks | Fisheries Co-management through Farms
Sharing experiences | Marine Protected Area Learning Site for the Coral Triangle
Social and political support and partnership | Community-based Conservation at Scale – The Bird’s Head Seascape
Glossary of Building Blocks

63 Multi-stakeholder workshop | Water and Fire Management of a Peat Swamp Forest
49 National consultation meeting | Regional Strategy on Coastal Erosion Management
55 Participatory consultation process | Co-management of Mangrove Forests
41 Participatory development of the act | Tubbataha Reefs Natural Park Act
39 Participatory Diagnosis and Adaptive Management (PDAM) | Strengthening Governance of Small-scale Fisheries
55 Pluralistic co-management board | Co-management of Mangrove Forests
39 Rapid Appraisal of a Fisheries Management System (RAFMS) | Strengthening Governance of Small-scale Fisheries
15 Repeated community consultations | Naga Data Island Co-management
21 Social and political support and partnership | Community-Based Conservation at Scale: The Bird’s Head Seascape
39 Strengthening the alliance and capacity building activities | Strengthening Governance of Small-scale Fisheries
17 Village level institutions | Integrated Mangrove Fishery Farming
15 Witnessing challenges and visualizing solutions | Naga Data Island Co-management
25 Zoning and management plan | Marine Protected Area Learning Site for the Coral Triangle

Strategy and Plan:

Process of developing reference / guiding documents, combines information from various sources, e.g. local & scientific knowledge

27 Adaptive and participatory locally based management | Palau’s Protected Areas Network Act
21 Co-management planning | Community-Based Conservation at Scale: The Bird’s Head Seascape
61 Designing and zoning an MPA for climate adaptation | Supporting the Development of the Resilient ECO- City Ho An: The Cham Islands Marine Protected Area
11 Developing a management plan of shared solutions | Adaptive, Community-Driven and Resilient Co-management Plan
23 Ecosystem-based spatial analysis and planning | Integrating Territorial and Marine Spatial Planning in Bontang City
15 Ensuring endorsement of end-product | Naga Data Island Co-management
15 Facilitating multi-input management plan | Naga Data Island Co-management
49 Regional assessment report | Regional Strategy on Coastal Erosion Management

Technical Method, Technique and Tool:

Related to technical efforts, can be used for different purposes throughout projects/efforts

17 Construction of fish ponds and bunds | Integrated Mangrove Fishery Farming
25 Ecological restoration | Marine Protected Area Learning Site for the Coral Triangle
23 Ecosystem-based spatial analysis and planning | Integrating Territorial and Marine Spatial Planning in Bontang City
45 Environmental assessment of dive centers | Green Fins: Responsible Diving
63 Fish management | Water and Fire Management of a Peat Swamp Forest
13 Fish Aggregating Devices (FADs) | Community-Based Ecosystem Approach to Fisheries Management
41 Locally-based park management and law enforcement | Tubbataha Reefs Natural Park Act
33 Mangrove eco-park | Mangrove Conservation and Rehabilitation
59 Mangrove regeneration | Ecosystem-Based Coastal Protection Through Floodplain Restoration
51 Mangrove restoration – implementation | Community-Based Ecological Mangrove Restoration for Natural Mangrove Recruitment
59 Numeric modelling of hydro- and sediment-dynamics | Ecosystem-Based Coastal Protection Through Floodplain Restoration
33 Reversion of abandoned ponds to mangroves | Mangrove Conservation and Rehabilitation
33 Seafront mangrove planting | Mangrove Conservation and Rehabilitation
51 Site suitability assessment | Community-Based Ecological Mangrove Restoration for Natural Mangrove Recruitment
11 Testing of conservation and rehabilitation techniques | Adaptive, Community-Driven and Resilient Co-management Plan
63 Water management | Water and Fire Management of a Peat Swamp Forest
